Dear Hiring Manager,

I'm applying for the ReactJS Developer opening listed on your careers page. I'm a frontend engineer based in Mohali, so your Phase 8-B office is a local commute, and I can start immediately. My resume is attached.

Most of my React work comes from a year-long frontend internship at KoinX, where I shipped 11 production features across 7 repositories in React, JavaScript, TypeScript and Redux Toolkit. A good share of that was the component and architecture work your posting describes: I designed reusable components — an OTP input, a charting suite, a filter-display layer — for the organisation's shared design system, and contributed 19 pull requests to the component library that three of their products consumed. Keeping those APIs backward-compatible as they outgrew their original use case taught me more about frontend structure than any single feature did. I work in HTML, CSS, Bootstrap, Sass and Tailwind depending on what a project already uses.

Your posting also asks specifically about API implementation and about debugging, and those are the parts of the job I enjoy most. At KoinX I built interfaces against REST APIs day to day, and in my own project Cryptax I wrote both ends — a React 19 and Next.js dashboard on top of an Express API I built in TypeScript — including an Axios interceptor that collapses concurrent 401 responses into a single token refresh so an expiring session never reaches the user. On the debugging side, I removed a timezone dependency in transaction timestamp conversion and added null-safety across amount and currency rendering, in a product where a display error has tax-filing consequences. On my Blood Link project I ran a documented hardening pass: non-atomic uploads that orphaned stored files, a silent form-key mismatch that dropped data before it reached the database, and debug logging that leaked user IDs.

All three of my projects are live with source you can read — Cryptax, Blood Link and a multi-tenant faculty feedback platform — and the links are on my resume, so you can look at the actual code rather than take my word for it. I'm an early-career engineer rather than a decade-deep one, but the time I have has gone almost entirely into this stack, and I read a codebase's existing patterns before I add to it.

I'd welcome the chance to talk, and I'm happy to come in to your Mohali office at short notice. Thank you for your time.

Best regards,
Gautam Anand
