Dear Hiring Manager,

I'm writing to apply for the [Role] position at [Company]. I'm a software engineer who works mostly in React, TypeScript, and Next.js, and I like building things that other people end up relying on.

Most of that came from my year at KoinX, where I interned on the frontend. I shipped features across several repositories in a fast-moving codebase, which meant a lot of reading existing patterns before adding to them. I owned the transaction-categorization surface of the accounting platform end to end, and I contributed components — an OTP input, a charting suite, a virtualized-select refactor — to the shared library three of our products depended on. Working on a tax product also taught me to care about correctness in a way I hadn't before: a rounding error or a timezone bug there has real consequences, so I got used to checking my own work harder.

Outside of work I build full-stack projects to learn the parts my job didn't cover. I wrote a crypto-tax app with a deterministic tax engine and an AI assistant that's deliberately not allowed to make up numbers, and a location-aware blood-donation platform backed by PostgreSQL and PostGIS. They're solo projects, but they're where I've done my deepest thinking about data modeling and security.

I'd welcome the chance to talk about how I can help your team. Thank you for your time.

Best regards,
Gautam Anand
