Dear Hiring Manager,

I'm applying for the ReactJS Developer role at Matrix Marketers. I'm a frontend-focused software engineer who works day to day in React, JavaScript, and Redux, and I'm based in Mohali — so the onsite setup is exactly what I'm looking for.

My React experience comes from a year on the frontend at KoinX. I shipped production features across several repositories, built in React, JavaScript (ES6+), and Redux Toolkit, and spent a lot of that time on reusable components: I contributed things like an OTP input, a charting suite, and a virtualized-select refactor to a shared component library that three of our products used. That work is squarely what your posting describes — building user-facing features and reusable libraries that other teams then build on. I also worked against RESTful APIs with React Query for the data layer, and put real effort into responsive behaviour and performance in the final phase, including bundle-size reduction and component memoization.

A few of your nice-to-haves are also things I reach for by default: I write most of my code in TypeScript, use Next.js and JSON Web Token authentication in my own full-stack projects, and I'm comfortable in a Node.js/Express backend when a feature needs it. I'm an early-career engineer rather than a decade-deep one, but I've spent that time going deep on exactly this stack, and I learn a codebase by reading its patterns before I add to it.

I'd genuinely like to build this kind of work here in Mohali, and I'd welcome the chance to talk. Thank you for your time.

Best regards,
Gautam Anand
